Source Control:

Github, Git, SCRUM/Agile

UI/UX Design:

Adobe Suite, Affinity Designer,
Inkscape, Prototyping, Figma,
Atomic Design, Wire-framing, UML
Design

Education

University of South Carolina

To say that I love programming would be a big understatement. I love watching tech talks to discover new technologies and using what I learn to improve older project or implement into new ones.

I am most comfortable using the MERN (MongoDB, Express, React, Node.js) stack however I can adapt any part of the stack to accommodate your needs. I also dabble in iOS development primarily using SwiftUI, and occasionally UIKit.

Experience

Job Title: Principle Full-Stack Engineer*
Company: Touch Speed

Details and Duties

Design and implementation of the TouchSpeed MVP.

Job Title: Principle Full-Stack Engineer*
Company: Junior Level Software Jobs

Details

This application uses a custom configured ngNix Web Server that is hosted on Digital Ocean, and served to a React frontend. SSL certification is authenticated with Certbot; Redis is also incorporated in the server to store scrapped data from the ram of the server for quicker access compared to a traditional database. The application is designed to be scalable allowing web-scrapping from any job posting site and conjugated in one location.

Job Title: Software Engineer*
Company: The Recipe Guide

Details

Front-End that receives and consumes a JSON object from the publicly available API. This particular project is hosted on Netlify an implements React web hooks and uses the fetch API from Javascript.

* These are passion projects, the job titles are meant to be a representation of skill based upon thing implemented in each project
